

SQL UNIONS

Bonus 01

The fraud analyst should use UNION to get a list of unique customers who appeared in the January and February table. By combining the two tables, UNION will remove duplicates in both tables and the output table list will contain names that appear once.

Bonus 02

The auditing team should use UNION ALL to count any transaction that passed through the bank in Q1 on two different systems. This ensures that data is collected faster when combining tables, and will keep all duplicate transactions from two systems.

Bonus 03

The developer query fails because the first SELECT returns two columns while the second SELECT returns three columns. UNION requires both SELECT statements to return the same number of columns with compatible data types. To fix the query, either remove the city column from second SELECT or add a city column to the first SELECT so that both queries return the same number of columns.
